

Navigating the field of spine without assistance can feel overwhelming. Many people have friends or family members with variable outcomes after back or neck surgery, and it can be difficult to make sense of these differences. Dr. Devin believes that total transparency in surgical outcomes is the patient's right, and he has been a leader in developing a national database to provide patients with transparency surrounding their surgical care. We collect data on patient satisfaction, pain, function and complication rates on all of our surgical patients, with a 98% follow up rate at three months. This means that we track nearly all patients, and our statistics are a true reflection of surgical quality. This is information that we are proud to provide to patients and referring providers. The graphs included in this brochure demonstrate that our patients have significant improvement in physical function, social participation, and reduction in pain following spine surgery. Furthermore nearly 90% of patients are satisfied with their outcome, which far exceeds the national benchmark of 80% satisfaction of care following spine surgery.

SATISFACTION WITH SURGERY

Dr. Devin understands that not every patient is at the point of considering surgery, and this is why we have a full time physician providing non-operative spine care. Dr. Tracy is a physiatrist with special interest in spinal injections, exercise science, electrodiagnostics and spine imaging interpretation. Many patients simply want to understand the source of their back or neck pain, and would like a thorough diagnostic evaluation, along with education regarding their diagnosis and treatment options. We take time to make sure you understand your options.

Our team is honored and humbled to provide quality comprehensive spine care for patients in Wyoming and Colorado. There are few ailments that create more disability than spine pain, and we are here to assist you.
